

Project Short Description

The project focuses on the "heartbeat" of a modern retail store: its sales and logistics data. Using a dataset of over 9,800 transactions, I have performed a deep-dive analysis to uncover the stories hidden behind the numbers. By cleaning raw data and transforming it into actionable insights, this project explores how shipping efficiency, regional performance, and product profitability interact to determine a company's success.

The analysis moves beyond simple totals to look at the human element—identifying who the customers are, why their orders might be delayed, and which products are truly driving the business forward. To achieve this, I utilized a professional suite of data tools: Excel Power Query for advanced data transformation, Python (Anaconda) for complex data processing, and SQL Server for structured data modeling. The final stage involves translating these numbers into a high-impact visual narrative using Excel Pivot Tables and Power BI dashboards.
